Java Class(es): classes within package gui

Can use a Dimension to set the size of a window

JComboBox is a drop-down list.

GridLayout specifies a number of rows and columns. If either is set to 0, then it can expand. E.g., if number of rows is 0, number of columns is 2, then there can be many rows, each with 2 columns.

Remember DRY. Can often use helper functions to set up GUI components.

JRadioButton requires a ButtonGroup to determine which buttons are a set (i.e., only one button within the set can be selected)
